We fit a hierarchical model to the survey and compare the recovered population with the injected one across all bins. We fit a hierarchical model to the survey and compare the recovered population with the injected one across all bins. We fit a hierarchical model to the survey and compare the recovered population with the injected one across all bins. We fit a hierarchical model to the survey and compare the recovered population with the injected one across all bins.

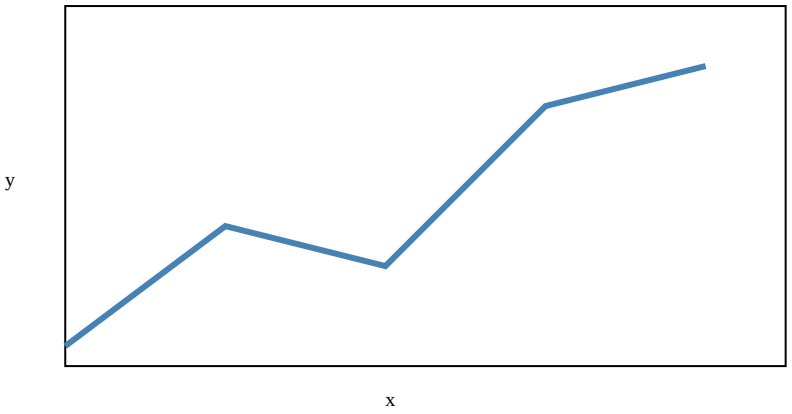

Figure 1. Recovered population versus the injected one, for every bin of the survey.

We fit a hierarchical model to the survey and compare the recovered population with the injected one across all bins. We fit a hierarchical model to the survey and compare the recovered population with the injected one across all bins. We fit a hierarchical model to the survey and compare the recovered population with the injected one across all bins. We fit a hierarchical model to the survey and compare the recovered population with the injected one across all bins. We fit a hierarchical model to the survey and compare the recovered population with the injected one across all bins.

As Figure 1 shows, the recovery is unbiased.
